Shredder: change list

Requested app changes, collected 28 Oct 2026. To be implemented one at a time; each change is committed and pushed to GitHub when done.

A. Performance and updates

1	**Battery and speed**	Battery optimisation is poor. Data takes a long time to fetch and the app takes a long time to open. Improve start-up time, data loading and background battery use.	☐
2	**Updates under user control**	The app should not update itself silently. Show a pop-up when an update is available, add an update option in Settings, and let the user turn auto-update on or off.	☐

B. Look and feel

3	**Customize layout: floating cards**	When "Customize layout" is tapped, make the cards float (lifted) instead of drawing a dotted outline around every tab, so it is obvious the layout is being edited.	☐
4	**Midnight-black theme**	Remove the orange gradient background. Use pitch / midnight black with an orange accent.	☐
5	**Pull-to-refresh position**	The reload spinner shown when dragging down currently appears under the notification (status) bar. Move it below the bar.	☐
6	**Better graphs**	Improve graphs overall. The workout line graphs feel gamified; make them cleaner, proper line graphs.	☐

C. Workouts and exercises

7	**Map custom exercises to the library**	Some previously logged exercises show as "custom" even though they exist in the exercise database. Map them to the library entries.	☐
8	**Duration in seconds**	Show workout duration down to seconds.	☐
9	**Weight and reps inputs**	While logging a workout, the weight and reps fields can be scrolled inside, and the text field is slightly larger than the box drawn around it. Fix both.	☐

D. Today tab

10	**Calendar icon**	Add a calendar icon in the Today header (where the settings icon is). It opens a calendar; picking a date shows the full summary for that day: workout, water, sleep, steps, food and everything else.	☐
11	**Remove settings icon**	Remove the settings icon from the Today page (Settings moves to the Profile page).	☐

E. Progress becomes Profile

12	**Profile tab**	Turn the Progress page into a Profile page.	☐
13	**Header icons (top right)**	**Settings**; next to it **Share** (shares your profile); next to that **Edit** (profile picture, name, bio, gender, birthday).	☐
14	**Settings sections**	Profile, Account, Notifications, Calculators (calorie, macro, body fat, BMI, BMR and more), Units, Integrations, Import / export data, FAQ, Contact us.	☐
15	**Profile header**	Profile picture and name, with totals for workouts logged, diet logged and days the step goal was completed, plus a bar graph of that data.	☐
16	**Dashboard**	Below the header, a dashboard with statistics for workout, diet, sleep and everything else. Workout stats show the body figure with the muscle groups trained that week highlighted.	☐
17	**Body measurements**	In the dashboard, log body weight, body fat and all body measurements, and see their trends on graphs.	☐

Open questions to settle before implementation

- **Share profile (13):** share a summary image, or text / a link?
- **Profile totals (15):** count days with anything logged, or only days a goal was met (for workout, diet and steps)?
- **Update pop-up (2):** with auto-update off, check on every launch and prompt, or only check when asked from Settings?
- **Dashboard sleep / diet stats (16):** which figures matter most (weekly averages, streaks, goal hit rate)?

Appendix: original notes

First of all the battery optimization is bad. We need to improve it. The data takes a long time to get fetched and the app takes a long time to open. Now the app should not auto-update. It should give a pop-up or the option for an update should be in the settings and the user must be able to Turn off or on the auto update. On clicking "Customize layout" instead of giving a dotted outline around all the tabs, I want you to make it float so that they know the layout is being edited. I do not prefer a gradient orange background. I wanted to have a pitch-black, like midnight black, color with an orange accent. As I mentioned earlier there are a few exercises that I have logged previously, which exist in the exercise database but they are not mapped together. There are some exercises that show as custom even though they exist in the exercise database. I want you to map them. The duration of the workout should be down to seconds as well. When I drag down to reload the screen, the reload animation is going under the notification bar. These are the small changes that make your app feel better. While logging the workout the field to enter weight, and reps Is being able to get scrolled.The text field is slightly larger than the text box that appears. In the Today tab beside the settings icon, I want you to give a calendar icon which redirects to the calendar. The particular date will show the entire summary of that date, including the workout, water, sleep, steps, everything. Turn the progress page into a profile page. On the top-right corner Of the profile page add settings which should contain the following tabs:
- Profile
- Account
- Notification
- Calculators which have all kinds of calculators, like calorie, macro, body fat, BMI, BMR, and so on
- Units
- Integration
- Import or export data
- FAQ
- Contact us

Beside this setting icon there should be a share icon, which will share your profile. Beside that there should be an edit icon, which will let you edit your profile, which will have a picture field, name, bio, your gender, and birthday. Now the main profile page will show your profile picture with your name and the total number of logged for workout, diet, and steps when you have completed the goal. And the corresponding data represented in a bar graph below it below it give a dashboard that will show the

statistics for workout, diet, sleep, everything: the workout statistics should show the character and highlight all the muscle groups that were trained in that week. And I also want body measures to be here in the dashboard, where they can log body weight, body fat, all body measures, and check the trends using the graph. The graph could be improved overall. The line graphs used in workouts are not that good. Make it a little less gamified and more like a line graph. Remove the settings icon from the Today page.
